

uniform motion

- constant velocity
- constant acceleration

must have uniform motion in order to use 5 formulas

ex) how would we visually describe uniform motion

This image describes a ball travelling @ constant velocity

The change in magnitude describes the objects change in its speed

This is called acceleration or gravitational constant

$$\vec{g} = -9.80 \frac{m}{s^2}$$

This a special type of \vec{a}

\vec{g} is drawn in red, the magnitude never changes

ex) pg 69 #2

since we are interested in objects dropping
we ONLY consider the vertical axis

$$g = -9.80 \text{ m/s}^2 \quad \{ \text{understood} \}$$

$$t = 0.50 \text{ s}$$

$$v_{iy} = v_{yi} = 0 \quad \{ \text{understood} \}$$

$$d_y = ?$$

$$d_y = v_{iy}t + \frac{1}{2}gt^2$$

$$= \left(0 \frac{\text{m}}{\text{s}}\right)(0.50 \text{ s}) + \frac{1}{2}(-9.80 \frac{\text{m}}{\text{s}^2})(0.50 \text{ s})^2$$

$$= \boxed{-1.2 \text{ m}}$$

downward, displacement is @ lve

ex 6)

$$t = .550 \text{ s}$$

$$d_y = -11.2 \text{ m}$$

$$g = -9.80 \frac{\text{m}}{\text{s}^2}$$

$$v_{yi} = ?$$

$$d_y = v_i t + \frac{1}{2}gt^2 \quad \left. \vphantom{d_y} \right\} 1$$

$$v_i = \underline{d_y - \frac{1}{2}gt^2} \quad \left. \vphantom{v_i} \right\} 1$$

$$V_i = \frac{-11.2 \text{ m} - \frac{1}{2}(-9.80 \frac{\text{m}}{\text{s}^2})(.550 \text{ s})^2}{(.550 \text{ s})}$$

$$V_i = -17.7 \frac{\text{m}}{\text{s}}$$

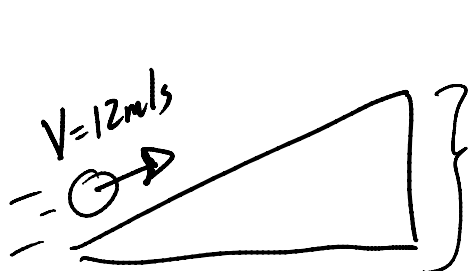

pg 69 # 1-21 odd

Skip lesson 6 for now jump to 7

- rolling up, down inclines

ex) a ball is rolled up a constant slope with an initial velocity of 12.0 m/s , if the ball's disp is 0.500 m up the slope after 3.60 s , what is the velocity of the ball @ this time

$V = 12 \text{ m/s}$

disp 99.9% of the time
 $d = 0.500 \text{ m}$
 $t = 3.60$
 $V_f = ?$
 $V_i = 12.0 \text{ m/s}$

1 mark

$$2 \frac{d}{t} = \left(\frac{V_i + V_f}{t} \right) t \quad \text{1 mark}$$

$$V_i + V_f = \frac{2d}{t} - V_i$$

$$V_f = \frac{2(0.500 \text{ m})}{3.60 \text{ s}} - 12.0 \text{ m/s}$$

$$= \boxed{-11.7 \text{ m/s}}$$

#2 pg 99

$$V_i = 9.3 \text{ m/s}$$

$$d = 1.9$$

$$t = 2.7 \text{ s}$$

$$a = ?$$

1 mark

$$d = v_i t + \frac{1}{2} a t^2$$

$$\frac{2(d - v_i t)}{t^2} = \frac{a t^2}{t^2} \quad a = \frac{2(d - v_i t)}{t^2} \quad \left. \vphantom{\frac{2(d - v_i t)}{t^2}} \right\} 1 \text{ mark}$$

$$a = \frac{2(1.9 \text{ m} - 9.3 \frac{\text{m}}{\text{s}} \cdot 2.7 \text{ s})}{(2.7 \text{ s})^2} \quad \left. \vphantom{\frac{2(1.9 \text{ m} - 9.3 \frac{\text{m}}{\text{s}} \cdot 2.7 \text{ s})}{(2.7 \text{ s})^2}} \right\} 1 \text{ mark}$$

$$= \boxed{-6.4 \frac{\text{m}}{\text{s}^2}}$$

#8 pg 101

$$g = -9.80 \frac{\text{m}}{\text{s}^2}$$

$$v_i = 10.0 \frac{\text{m}}{\text{s}}$$

$$d_g = 5.0 \text{ m}$$

$$v_f = \quad \left. \vphantom{\frac{10.0 \text{ m}}{\text{s}}} \right\} 1 \text{ mark}$$

$$v_f^2 = v_i^2 + 2gd$$

$$v_f = \pm \sqrt{v_i^2 + 2gd} \quad \left. \vphantom{\pm \sqrt{v_i^2 + 2gd}} \right\} 1 \text{ mark}$$

$$= \pm \sqrt{(10 \text{ m/s})^2 + 2(-9.80 \frac{\text{m}}{\text{s}^2})(5.0 \text{ m})}$$

+ ...

$$= +1.4 \frac{m}{s}$$

$$= -1.4 \text{ m/s} \quad \text{since it's on its way down}$$

$$v_f = 1.4 \frac{m}{s} \text{ down}$$
